Antidepressants

This factsheet gives information about antidepressants. Antidepressants can help with different mental health problems, including low mood, depression, and anxiety.

- Antidepressant medications are used to treat depression and other mood disorders.
- There are different types of antidepressants. You may need to try different ones before finding one that works for you.
- You may get side effects from antidepressants. Talk to your doctor if you get side effects that cause you problems.
- You may get withdrawal symptoms when you stop taking antidepressant medication. Talk to your doctor before you stop taking them. Your doctor may take you off your medication slowly if you have been taking them for a long time.
- Antidepressant medication can affect other medications. Tell your doctor if you take any other medication.
This factsheet covers:

1. What are antidepressants?
2. Are there different types of antidepressants?
3. Are there any side effects?
4. What if I want to stop taking antidepressants?
5. Do antidepressants affect other medication?
6. Does alcohol affect my antidepressants?
7. Can I drive when taking antidepressants?
8. What else should I consider when before taking antidepressants?

1. What are antidepressants?

Your doctor may offer you antidepressants if you have very low mood or symptoms of depression. They can also help if you have other mental health problems, including anxiety.\(^1\)

Scientists aren’t sure how antidepressants work. But they think that they may work by increasing levels of certain chemicals in your brain that help improve your mood and emotions.\(^2,3\)

Antidepressants should start to work within 2-3 weeks.\(^4\) There is no set time for how long you should take antidepressants. Your doctor may ask you to take your antidepressants for 6 months after your symptoms are gone.\(^5\) This can help stop your symptoms coming back. Your doctor will work out how much you should take, and for how long. Antidepressants are not addictive.\(^6\) But you may get withdrawal symptoms if you stop taking them suddenly.\(^7\)

2. Are there different types of antidepressant?

All antidepressants work in different ways. One type of antidepressant may suit you more than another. Here, we give an overview of the different types.

**Selective serotonin re-uptake inhibitors (SSRIs)**

The National Institute for Health and Clinical Excellence (NICE) suggests that SSRIs have fewer side effects than the other types of antidepressants.\(^8\) All the following medications treat low mood and depression. Some may also treat other conditions, including anxiety, bulimia, panic disorder, and obsessive-compulsive disorder.\(^9\)
<table>
<thead>
<tr>
<th>Medication name</th>
<th>Brand name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citalopram</td>
<td>Cipramil</td>
</tr>
<tr>
<td>Escitalopram</td>
<td>Cipralex</td>
</tr>
<tr>
<td>Fluoxetine</td>
<td>Prozac</td>
</tr>
<tr>
<td>Fluvoxamine</td>
<td>Faverin</td>
</tr>
<tr>
<td>Paroxetine</td>
<td>Seroxat</td>
</tr>
<tr>
<td>Sertraline</td>
<td>Lustral</td>
</tr>
</tbody>
</table>

**Serotonin-noradrenaline reuptake inhibitors (SNRIs)**
SNRIs are similar to SSRIs. They treat depression and chronic pain.\(^{10}\)

<table>
<thead>
<tr>
<th>Medication name</th>
<th>Brand name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duloxetine</td>
<td>Cymbalta, Yentreve</td>
</tr>
<tr>
<td>Venlafaxine</td>
<td>Efexor</td>
</tr>
<tr>
<td>Reboxetine</td>
<td>Edronax</td>
</tr>
</tbody>
</table>

**Tricyclic antidepressants**
Tricyclic antidepressants can treat depression, panic disorder, obsessive compulsive disorder and migraine.\(^{11}\) Tricyclic antidepressants can take 2 to 4 weeks to work. These are older medicines, and generally have more side effects than other antidepressants.

Below is a table of tricyclic antidepressants and their trade names.\(^{12}\)

<table>
<thead>
<tr>
<th>Medication name</th>
<th>Brand name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amitriptyline</td>
<td>Triptafen, Tryptizol</td>
</tr>
<tr>
<td>Clomipramine</td>
<td>Anafranil</td>
</tr>
<tr>
<td>Doxulepin or dothiepin</td>
<td>Prothiaden, Dothapax</td>
</tr>
<tr>
<td>Doxepin</td>
<td>Xepin, Sinepin</td>
</tr>
<tr>
<td>Imipramine</td>
<td>Tofranil</td>
</tr>
<tr>
<td>Lofepramine</td>
<td>Lomont, Feprapax, Gamanil</td>
</tr>
<tr>
<td>Nortriptyline</td>
<td>Allegren</td>
</tr>
<tr>
<td>Mianserin</td>
<td>Bolvidon</td>
</tr>
<tr>
<td>Trimipramine</td>
<td>Surmontil</td>
</tr>
</tbody>
</table>

**Mono-amine oxidase inhibitors (MAOIs)\(^{13}\)**
MAOIs are an older antidepressant. These are not prescribed as much. Your doctor should monitor you if you take these. You cannot eat certain foods if you take these. Your doctor should give you more information if they prescribe these for you.
Other medication

Below is a table of other medicines which can treat depression.

<table>
<thead>
<tr>
<th>Medication name</th>
<th>Brand name</th>
<th>Type of medicine</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mirtazapine</td>
<td>Zispin</td>
<td>Noradrenergic and Specific Serotonergic Antidepressant</td>
</tr>
<tr>
<td>Trazodone</td>
<td>Molipaxin</td>
<td>A Tricyclic medicine</td>
</tr>
</tbody>
</table>

3. Are there any side effects?

Different antidepressants will have different side effects. The newer antidepressants should have fewer side effects than the older ones. People can have different reactions to medication.

You should get a patient information leaflet with your medication. This leaflet will tell you all the possible side effects you might get. The table below tells you about the common side effects.

<table>
<thead>
<tr>
<th>Common Side Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SSRIs</strong></td>
</tr>
<tr>
<td>Nausea and vomiting, insomnia, sexual dysfunction (including loss of sex drive and difficulty in reaching orgasm)*14</td>
</tr>
<tr>
<td><strong>SNRI</strong></td>
</tr>
<tr>
<td>Like SSRIs, can cause high blood pressure*15</td>
</tr>
<tr>
<td><strong>Tricyclic Antidepressants</strong></td>
</tr>
<tr>
<td>Dry mouth, blurred vision, drowsiness, weight gain, constipation*16</td>
</tr>
<tr>
<td><strong>MAOIs</strong></td>
</tr>
<tr>
<td>Dizziness, drowsiness, dry mouth, constipation*17</td>
</tr>
</tbody>
</table>

If you get these symptoms you can talk to your doctor. They may be able to change your dosage or medication.

4. What if I want to stop taking antidepressants?

If you have been taking antidepressants for a few weeks you should not stop taking them suddenly. Antidepressants are not addictive but your
body can become used to them. If you stop taking them suddenly you get withdrawal symptoms.\textsuperscript{18}

You should talk to your doctor before stopping your medication. You can stop taking them slowly, which can help reduce withdrawal effects.

People can respond to coming off antidepressants differently. Some people will have no effects at all. Some common withdrawal effects are in the table below.\textsuperscript{19}

<table>
<thead>
<tr>
<th>Antidepressant</th>
<th>Common</th>
<th>Occasional</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSRI s</td>
<td>Dizziness, feeling irritable, problems sleeping, vivid dreaming, flu-like symptoms (for example feeling sick, headaches, sweating a lot, chills), feeling tearful, 'shock-like' feelings</td>
<td>Memory and concentration problems, movement disorders</td>
</tr>
<tr>
<td>SNRI s</td>
<td>Tiredness, dizziness, light-headedness, headache, sleeplessness, nightmares, dry mouth, loss of appetite, nausea, diarrhoea, nervousness, agitation, confusion, ringing in the ears, tingling</td>
<td>Electric shock sensations, weakness, sweating, seizures, or flu-like symptoms</td>
</tr>
<tr>
<td>Tricyclic Antidepressants</td>
<td>Problems sleeping, dreaming a lot, flu-like symptoms (for example nausea, headaches, excessive sweating, chills).</td>
<td>Movement problems, feeling and acting high, unusual heart pace</td>
</tr>
<tr>
<td>MAOIs</td>
<td>Drowsiness, anxiety and feeling irritable, sleep disturbance, dreaming a lot, slowed speech and a lack of muscle coordination.</td>
<td>Hallucinations, delusions</td>
</tr>
</tbody>
</table>

5. Do antidepressants affect other medication?

This section is just a summary. You should tell your doctor or pharmacist about any medicines you take before you start or stop other medications. This includes over the counter medication, herbal or complementary remedies or medicines such as:

- ibuprofen,
- illegal drugs,
other antidepressants,
St John’s Wort, or
anaesthetics.

Read through the medicine leaflet before you start taking any medicine. You can find medicine leaflets online, on the electronic Medicines Compendium at www.medicines.org.uk.

Do any foods affect antidepressants?
There are some foods that have an amino acid (protein) called tyramine that you should not eat if you are taking MAOIs. Tyramine can build up in your body if you eat it when you are taking MAOIs. Examples of foods that have this protein are:

- cheese,
- pickled or salted meats or fish,
- overripe fruits and vegetables, and
- Oxo, Marmite, or Bovril.

If you are taking this medication, ask your doctor about any foods that you should not eat.

6. Does alcohol affect my antidepressants?

Drinking alcohol while taking antidepressants is not advised because alcohol can make depression worse. It can also increase the side effects of some antidepressants, like drowsiness, dizziness, and co-ordination problems.

To avoid alcohol-related harm, the NHS recommends that you should drink no more than 14 units of alcohol a week. It’s best to spread this evenly over three or more days.

You should not drink certain wines or beers if you are taking MAOIs. You should ask your pharmacist or doctor for more information.

7. Can I drive when taking antidepressants?

Some antidepressants can affect your ability to drive. You may feel drowsy from your medication, which can affect your reaction time. If your antidepressants make you drowsy you should not drive.

You should tell the DVLA if you are taking medication that may affect your driving. You should also tell them if you have a medical condition that could affect your driving.
8. What else should I consider before taking antidepressants?

**Sex**
Taking antidepressants may affect your sex life. Antidepressants can make you feel tired and can affect your hormones.

Side effects include:

- lower sex drive,
- problems with getting an erection,
- difficulty ejaculating or having an orgasm, and
- poor vaginal lubrication.

If you are having these problems, talk to your doctor. You might be able to change medication, or the amount you take.

**Pregnancy**
You can take some antidepressants if you are pregnant, but you should talk to your doctor. You may want to stay on antidepressants during your pregnancy, if you think your symptoms will come back. Some antidepressants may be better for you during pregnancy.

If you are pregnant, some antidepressants can affect the baby. Some possible effects can be:

- low birth weight,
- being uneasy and bad tempered,
- heart disease, and
- pulmonary hypertension (high blood pressure in the blood vessels between your lungs and heart).

Talk to your doctor if you are pregnant, or plan on getting pregnant.

**Breast feeding**
Small amounts of antidepressants can pass into your breast milk. Talk to your doctor or midwife about the risks and benefits of breastfeeding. Some antidepressants are better if you are breastfeeding, and your doctor can tell you about this.
Bristol Tranquilliser Project
Bristol Tranquilliser Project provides help to people who are experiencing involuntary addiction to prescribed minor tranquillisers, sleeping pills and antidepressants. Their helpline is available to those living in England, Wales, Scotland and Northern Ireland.

**Telephone:** 0117 950 0020 (10am - 3.30pm Monday – Thursday).
**Address:** Suite 5A, Westbury Court, Church Road, Westbury-on-Trym, Bristol BS9 3EF

Rethink Mental Illness Advice Service

Phone 0300 5000 927
Monday to Friday, 9:30am to 4pm (excluding bank holidays)

Email advice@rethink.org

Did this help?
We’d love to know if this information helped you.

Drop us a line at: feedback@rethink.org

or write to us at Rethink Mental Illness:
RAIS
PO Box 17106
Birmingham B9 9LL

or call us on 0300 5000 927.

We’re open 9:30am to 4pm
Monday to Friday (excluding bank holidays)

Need more help?
Go to www.rethink.org for information on symptoms, treatments, money and benefits and your rights.

Don’t have access to the web?
Call us on 0121 522 7007. We are open Monday to Friday, 9am to 5pm, and we will send you the information you need in the post.

Need to talk to an adviser?
If you need practical advice, call us on 0300 5000 927 between 9:30am to 4pm, Monday to Friday. Our specialist advisers can help you with queries like how to apply for benefits, get access to care or make a complaint.

Can you help us to keep going?
We can only help people because of donations from people like you. If you can donate please go to www.rethink.org/donate or call 0121 522 7007 to make a gift. We are very grateful for all our donors’ generous support.
